L4 ANSWER 1 OF 11 MEDLINE on STN
TI Controlled release of an osteogenic peptide from injectable biodegradable polymeric composites.
AB Poly(D,L-lactic-co-glycolic acid)/poly(ethylene glycol) (PLGA /PEG) blend microparticles loaded with the osteogenic peptide TP508 were added to a mixture of poly(propylene fumarate) (PPF), poly(propylene fumarate)-diacrylate (PPF-DA), and sodium chloride (NaCl) for the fabrication of PPF composite scaffolds that could allow for tissue ingrowth as well as for the controlled release of TP508 when implanted in an orthopedic defect site. In this study, PPF composites were fabricated and the in vitro release kinetics of TP508 were determined. TP508 loading within the PLGA/PEG

microparticles, PEG content within the **PLGA**/PEG microparticles, the microparticle content of the PPF composite polymer component, and the leachable porogen initial mass percent of the PPF composites were varied according to a fractional factorial design and the effect of each variable on the release kinetics was determined for up to 28 days. Each composite formulation released **TP508** with a unique release profile. The initial release (release through day 1) of the **PLGA**/PEG microparticles was reduced upon inclusion in the PPF composite formulations. Day 1 normalized cumulative mass release from PPF composites ranged from 0.14+/-0.01 to 0.41+/-0.01, whereas the release from **PLGA**/PEG microparticles ranged from 0.31+/-0.02 to 0.58+/-0.01. After 28 days, PPF composites released 53+/-4% to 86+/-2% of the entrapped peptide resulting in cumulative mass releases ranging from 0.14+/-0.01 microg **TP508**/mm(3) scaffold to 2.46+/-0.05 microg **TP508**/mm(3) scaffold. The results presented here demonstrate that PPF composites can be used for the controlled release of **TP508** and that alterations in the composite's composition can lead to modulation of the **TP508** release kinetics. These composites can be used to explore the effects varied release kinetics and dosages on the formation of bone in vivo.

L4 ANSWER 4 OF 11 USPATFULL on STN

TI Stimulation of cartilage growth with agonists of the non-proteolytically activated thrombin receptor
 AB Disclosed is a method of stimulating cartilage growth, repair or regeneration at a site in a subject in need of such growth, repair or regeneration. The method comprises the step of administering a therapeutically effective amount of an agonist of the non-proteolytically activated thrombin receptor to the site.

Also disclosed is a method of stimulating the proliferation and expansion of chondrocytes in vitro. The method comprises culturing chondrocytes in the presence of a stimulating amount of an NPAR agonist.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

TI Methods of therapy with thrombin derived peptides
 AB The present invention relates to a method for promoting cardiac tissue repair comprising administering to the cardiac tissue a therapeutically

effective amount of an angiogenic thrombin derivative peptide and/or inhibiting or reducing vascular occlusion or restenosis. The invention also relates to methods of stimulating revascularization. In yet another embodiment, the invention relates to the use of thrombin derivative peptides in the manufacture of a medicament for the methods described herein.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L4 ANSWER 10 OF 11 WPIDS COPYRIGHT 2004 THOMSON DERWENT on STN
TI Stimulation of bone growth and cartilage formation in e.g. bone graft and
arthritic joints involves administration of a thrombin derivative peptide.
AN 2003-721552 [68] WPIDS
AB WO2003061690 A UPAB: 20031022
NOVELTY - Stimulating bone growth, comprising administering a thrombin

derivative peptide, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for:

- (1) a pharmaceutical composition comprising an implant able, biocompatible carrier and a thrombin derivative peptide; and
- (2) culturing chondrocytes in vitro in the presence of a thrombin derivative peptide and further administering the cultured chondrocytes to a cartilage repair or growth site.

ACTIVITY - Osteopathic; Antiarthritic.

MECHANISM OF ACTION - Non-proteolytic thrombin receptor agonist.

Young, male New Zealand rabbits (2-3 kg) (test) with defects in the trochlear groove of the femur were treated with **TP508** (RTM) (thrombin receptor agonist) (10 mg) formulated in polylactic acid/polyglycolic acid (**PLGA**) controlled release microspheres. The control rabbits received **PLGA** microspheres without **TP508** (RTM). After 9 weeks, the test rabbits exhibited a predominantly hyaline matrix with evidence of significant aggrecan content. The repair score for test/control rabbits were: 18.6 plus or minus 1.4/9.4 plus or minus 1.6 respectively.

USE - For stimulating bone growth and cartilage growth or repair in e.g. bone graft, segmental gap in a bone, bone void, at a non-union fracture, arthritic joints, and sites treated for cartilage damage or loss due to traumatic injury, and for culturing chondrocytes in vitro (claimed).

ADVANTAGE - The thrombin derivative peptide improves the quality of repair tissue, leads to more durable and functional restoration of joint bio mechanics, reduces the incidence of osteoarthritis in patients suffering from traumatic cartilage injuries and accelerates the rate of normal fracture healing in fracture or small gap defects.

L4 ANSWER 11 OF 11 WPIDS COPYRIGHT 2004 THOMSON DERWENT on STN
TI Promoting cardiac tissue repair, stimulating revascularization,

stimulating vascular endothelial cell proliferation, and inhibiting vascular occlusion by using angiogenic thrombin derivative peptide.

AN 2002-179665 [23] WPIDS

AB WO 200204008 A UPAB: 20020411

NOVELTY - Promoting cardiac tissue repair or stimulating revascularization, stimulating vascular endothelial cell proliferation, inhibiting restenosis in a patient following balloon angioplasty, and for inhibiting vascular occlusion in a patient by administering an angiogenic thrombin derivative peptide (I) to cardiac tissue or blood vessels.

ACTIVITY - Vasotropic; cardiant.

(I) was tested for vasotropic and cardiant activity. Yucatan minipigs had toroid shaped ameroid occluders placed on their proximal left circumflex arteries. The ameroid imbibed water over time, causing constriction of the vessel. Occlusion was verified four weeks after surgery by contrast enhanced angiography. At that time, each animal's chest was reopened, where upon the region of ischemia was injected with a slow release formulation of **TP508** (100 micro l, i.e., **TP508**-containing poly(D,L-lactide-co-glycolide) (**PLGA**) microspheres, suspended in a Pluronic gel, into 10 sites (100 micro l/site) in the ischemic area. Controls received **PLGA** microspheres in Pluronic gel without **TP508**. Baseline, and post-treatment angiograms and echocardiograms were obtained. Indices for myocardial wall thickening and cardiac ejection fraction showed trends that **TP508** treated animals tolerated dobutamine-induced stress better than controls. After 3 weeks, the animals were evaluated with contrast enhanced echocardiography. Initial results on this limited number of animals demonstrated that **TP508** treated animals under dobutamine stress had a slightly larger increase in ejection fraction and better maintained wall thickening compared to controls. Thus, this treatment appears to help restore functionality to the ischemic heart muscle.

MECHANISM OF ACTION - Angiogenic proliferation and endothelial cells migration inducer.

USE - The method utilizing (I) is useful for promoting cardiac tissue repair, stimulating revascularization, stimulating vascular endothelial cell proliferation, inhibiting restenosis in a patient following balloon angioplasty, and for inhibiting vascular occlusion in a patient (claimed).

L14 ANSWER 1 OF 2 USPATFULL on STN

TI Stimulation of cartilage growth with agonists of the non-proteolytically activated thrombin receptor

AB Disclosed is a method of stimulating cartilage growth, repair or regeneration at a site in a subject in need of such growth, repair or regeneration. The method comprises the step of administering a therapeutically effective amount of an agonist of the non-proteolytically activated thrombin receptor to the site.

Also disclosed is a method of stimulating the proliferation and expansion of chondrocytes in vitro. The method comprises culturing chondrocytes in the presence of a stimulating amount of an NPAR agonist.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

ACCESSION NUMBER: 2002:344424 USPATFULL

TITLE: Stimulation of cartilage growth with agonists of the non-proteolytically activated thrombin receptor

INVENTOR(S): Carney, Darrell H., Dickinson, TX, UNITED STATES
Crowther, Roger S., League City, TX, UNITED STATES
Stiernberg, Janet, Paris, TX, UNITED STATES
Bergmann, John, Galveston, TX, UNITED STATES
